

Empathy Map

Date	15 July 2026
Team ID	TM-RISINGWATERS-04
Project Name	Rising Waters: AI Powered Flood Prediction System
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

PERSONA NAME

Local Disaster Management & Emergency Response Officer

SAYS

- "We need hyper-localized, street-level predictive indices rather than broad, generalized regional weather bulletins."
- "If we order an early evacuation falsely, we disrupt lives; but if we delay, we risk losing civilian safety entirely."
- "Can we easily verify how this ML system maps incoming rain parameters so our leadership fully trusts it?"

THINKS

- Traditional physical models are failing because global heating creates rapid, highly localized runoff variations.
- If I can accurately pinpoint specific watershed risks, I can optimize deployment of rescue boats and crews.
- How long will it take to run these predictive simulations when real-time emergency events are unfolding?

DOES

- Constantly watches and correlates various fragmented APIs, regional weather radars, and physical gauge metrics manually.
- Coordinates emergency response briefs and sets up community safety protocols before monsoon peaks begin.
- Traces past environmental topologies and manual logs of historical floods to estimate runoff vulnerabilities.

FEELS

- Deeply pressured and personally responsible for the immediate safety of thousands of local families.
- Frustrated by the critical delays between gathering raw weather parameters and translating them to active warnings.
- Encouraged and hopeful that a smart deep learning system can grant a life-saving 6-to-12-hour predictive buffer.
