

Customer Journey Map

Date	15 July 2026
Team ID	TM-RISINGWATERS-04
Project Name	Rising Waters: AI Powered Flood Prediction System
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1 Observation & Monitoring	Stage 2 Analysis & Forecasting	Stage 3 Emergency Warning Dispatch
Actions <i>What does the customer do?</i>	- Logs into the centralized dashboard to review active river levels and rainfall gauges. - Configures standard regional weather-reporting thresholds. - Traces telemetry reports across adjacent municipal sectors manually.	- Inputs current rainfall parameters into the system's predictive ML pipeline. - Evaluates AI-generated runoff forecasts and risk classification layers. - Compares ML-driven risk scores against local spatial terrain indexes.	- Triggers automated high-priority flood warnings across targeted districts. - Coordinates resource logistics and assigns field crews to high-risk areas. - Monitors live citizen response rates and public broadcast feeds.
Touchpoint <i>What part of the service do they interact with?</i>	- Telemetry and Sensor Monitoring Dashboard page. - Regional Meteorological Database API interfaces. - Manual Alert Configurator form.	- AI Inundation Predictor and interactive heat mapping visualization panel. - Confidence Interval graphs and Runoff Estimator sliders. - Risk-Level Classification indicator banners.	- Emergency SMS Broadcast utility and Mobile Push notification portals. - Field Command Resource Mapping module. - Interactive Citizen Report Feedback panel.
Customer Thought <i>What is the customer thinking?</i>	"Are these incoming sensor readouts synchronized, or are we working with stale telemetry records?" "Is the baseline rainfall indicator normal for this specific week of monsoon season?"	"Can I confidently rely on these deep learning flood runoffs to justify an early localized evacuation order?" "Which specific low-lying sectors will experience critical pooling first?"	"Did the warnings successfully reach everyone in the high-danger zone before nightfall?" "How can we minimize public panic while still stressing the absolute urgency of evacuation?"
Customer Feeling <i>What is the customer feeling?</i>	Vigilant: Highly attentive to fluctuating environmental readings. Uncertain: Wary of manual estimation delays in historical data.	Analytically Focused: Deeply evaluating model performance charts. Anxious: Pressured to draw correct, actionable hazard predictions.	Urgent & Determined: Fully driven to mobilize teams rapidly. Hopeful: Trusting the ML lead-time saves vital community assets.
Process Ownership			

Phase of Journey	Stage 1 Observation & Monitoring	Stage 2 Analysis & Forecasting	Stage 3 Emergency Warning Dispatch
<i>Who is in the lead on this?</i>	Data Integration Engineers & Metering Infrastructure Teams	Disaster Prediction Analysts & AI Model Administrators	Emergency Operations Command Director & Community Outreach Officers
Opportunities <i>How can we improve this stage?</i>	- Automate hardware failover checkups for real-time river telemetry monitors. - Optimize database sync latency from regional meteorological feeds.	- Integrate model explainability modules to explain AI confidence bounds visually. - Implement automated parameter validation to highlight faulty outlier inputs.	- Establish one-click, localized API hooks with telecommunication operators. - Implement a feedback reporting loop to allow field crews to update flood maps in real-time.
